

ServiceNow Project Documentation Format

Import Data using Transform Maps (Spreadsheet)

Team ID: SWTID-2026-8426 | Date: 03 October 2026

1. Introduction

- The micro project imports structured employee data from an external spreadsheet into ServiceNow using Import Sets and Transform Maps.
- The spreadsheet is staged in an Import Set table, mapped to a target table, transformed and validated.

2. Project Overview

- Employee Test target table: u_employee_test.
- Employee Import staging table: u_employee_import.
- Transform Map: Sample Spreadsheet Import.
- Reports: Employees by Department, Employees by Location and Employee List Report.
- Dashboard: Employee Analytics Dashboards.

3. Architecture

- Spreadsheet → Employee Import (staging) → Sample Spreadsheet Import Transform Map → Employee Test.
- Field mapping connects Employee ID, Employee Name, Email, Department and Location.
- Transform History validates Inserted, Updated and Ignored outcomes.
- Reports are added to Employee Analytics Dashboards.

4. Setup Instructions

- Prepare the spreadsheet and download Sample Spreadsheet.xlsx.
- Create Employee Test and the five fields.
- Use Load Data to create Employee Import.
- Create the Sample Spreadsheet Import Transform Map.
- Use Auto Map Matching Fields and Mapping Assist.

5. Data Structure

- Employee ID — String.
- Employee Name — String.
- Email — String.
- Department — String.
- Location — String.

6. Running the Application / Import

- Navigate to Load Data.
- Select Employee Import as the existing import set table for subsequent imports.
- Select the Excel file, Sheet number 1 and Header row 1.
- Submit and then run the previously selected Transform Map.

7. Transform Map Documentation

- Name: Sample Spreadsheet Import.
- Source Table: Employee Import.
- Target Table: Employee Test.
- Auto Map Matching Fields and Mapping Assist are used.
- Coalesce is enabled on a field map to avoid duplicate insertion.

8. Validation

- First test: 4 rows uploaded, 2 inserted and 2 updated.
- Repeated identical import: 4 rows uploaded, 0 inserted, 0 updated and 4 ignored.
- Employee Test and Transform History are used for verification.

9. Reports

- Employees by Department — Employee Test, Pie Chart, Group By Department, Count.
- Employees by Location — Employee Test, Bar Chart, Group By Location, Count.
- Employee List Report — Employee Test, List, columns Employee ID, Employee Name, Email, Department and Location.

10. Dashboard

- Dashboard name: Employee Analytics Dashboards.
- The three reports are added to the dashboard.
- The dashboard can restrict Users, Groups and Roles through Share options.

11. Screenshots / Demo

- The supplied document contains screenshots throughout the 31 pages showing the spreadsheet, ServiceNow tables, Transform Map, Transform History, reports and dashboard.

12. Known Constraints

- The supplied document does not specify API integrations or automated scheduled imports.
- Dashboard creation through the backend name requires the documented pa_dashboards ACL/Admin Override configuration.

13. Conclusion

- The source states that the project implemented employee data management using Import Sets and Transform Maps, with Coalesce for duplicate prevention and Reports/Dashboards for visibility into employee data and import activities.

Source Screenshots

Phase 4: Create Transform Map

In this phase we need to create the Transform Map by clicking on the Create Transform Map button as shown in above screenshot.

Give inputs as shown below.

Name: Sample Spreadsheet Import

Source Table: Employee Import is auto-populated

Target Table: Employee Test - as we created earlier

Click on Auto Map Matching fields.

Now click on Mapping Assist and map the fields with Source & Target Table

Click on Save

Make sure the both Source & Target table fields are mapped as shown below.

- Here the three Reports are added successfully by varying **Department , Location and List Report.**
- We can also restrict the **Users,Groups and Roles** From Share Option.

Conclusion:

1. This project successfully implemented an automated employee data management solution using ServiceNow Import Sets and Transform Maps, ensuring accuracy, efficiency, and data integrity throughout the employee onboarding and update process.
2. A key enhancement in this project was the use of Coalesce in the Transform Map. By enabling Coalesce on the Employee ID field, the system intelligently identifies existing employee records during every import. This prevents the creation of duplicate records and ensures that repeated imports update existing data instead of inserting redundant entries. As a result, the employee database remains clean, reliable, and consistent, which is critical in real-world enterprise environments where data may be imported multiple times from external systems.
3. In addition to data integrity, the project was extended with Reports and Dashboards to provide meaningful insights and real-time visibility into employee data and import activities. Custom reports were created to track:
